```

1.Reading and Splitting Data

In [2]:

```
#considering 10k points only due to constraints
data=pd.read_csv('/home/sathish/Desktop/appliedai/Donors_choose_preprocessed_data.csv',na_filter=False)
data=data.sample(10000,random_state=42)
x_train=data.drop(['project_is_approved'],axis=1)
y=data['project_is_approved']
```

2. Creating Data Matrix

2.1 converting text to vectors (Bow)

In [3]:

```
from sklearn.feature_extraction.text import CountVectorizer
vectorizer=CountVectorizer()
x_train_essay_bow=vectorizer.fit_transform(x_train['essay'].values)
x_train_summary_bow=vectorizer.fit_transform(x_train['project_resource_summary'].values)
x_train_title_bow=vectorizer.fit_transform(x_train['project_title'].values)
```

2.2 one hot encoding the categorical features

In [4]:

```
vectorizer=CountVectorizer()
x_train_state_onehot=vectorizer.fit_transform(x_train['school_state'].values)
x_train_tprefix_onehot=vectorizer.fit_transform(x_train['teacher_prefix'].values)
x_train_grade_onehot=vectorizer.fit_transform(x_train['project_grade_category'].values)
x_train_cat_onehot=vectorizer.fit_transform(x_train['project_subject_categories'].values)
x_train_subcat_onehot=vectorizer.fit_transform(x_train['project_subject_subcategories'].values)
```

2.3 Normalizing the numerical features

In [5]:

```
normalizer=Normalizer()
```

```
x_train_price_norm=normalizer.fit_transform(x_train['price'].values.reshape(-1,1))
x_train_quantity_norm=normalizer.fit_transform(x_train['quantity'].values.reshape(-1,1))
x_train_prev_projects_norm=normalizer.fit_transform(x_train['teacher_number_of_previously_posted_projects'].values.reshape(-1,1))
```

2.4 Building data matrix

In [6]:

```
#text features
bow_train=hstack((x_train_essay_bow,x_train_summary_bow,x_train_title_bow))

#all categrocial features
x_train_cat=hstack((x_train_state_onehot,x_train_tprefix_onehot,x_train_grade_onehot,x_train_cat_onehot,x_train_subcat_onehot))

#numerical features
x_train_num=hstack((csr_matrix(x_train_price_norm),x_train_quantity_norm,x_train_prev_projects_norm))

#final matrices
final_bow_train=hstack((bow_train,x_train_cat,x_train_num)).tocsr()
```

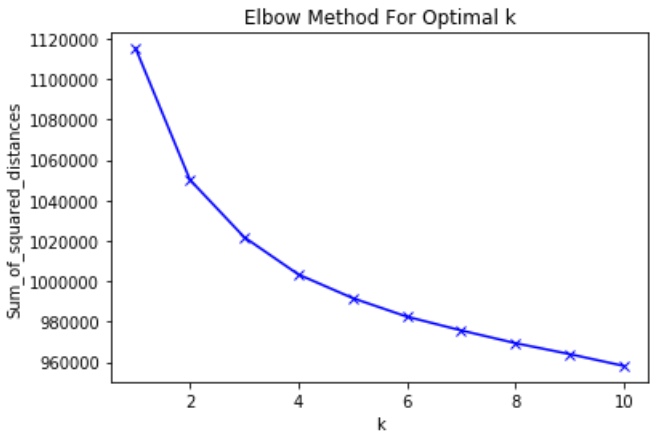
In [7]:

```
best_5k=SelectKBest(chi2,k=5000)
x_train_new=best_5k.fit_transform(final_bow_train,y)
```

3. Applying Kmeans

In [8]:

```
#https://blog.cambridgespark.com/how-to-determine-the-optimal-number-of-clusters-for-k-means-clustering-14f27070048f
Sum_of_squared_distances = []
K = range(1,11)
for k in K:
    km = KMeans(n_clusters=k)
    km = km.fit(x_train_new)
    Sum_of_squared_distances.append(km.inertia_)
plt.plot(K, Sum_of_squared_distances, 'bx-')
plt.xlabel('k')
plt.ylabel('Sum_of_squared_distances')
plt.title('Elbow Method For Optimal k')
plt.show()
```



In [9]:

```
#optimal k=5
kmeans=KMeans(n_clusters=5)
kmeans.fit(x_train_new)
predicted=kmeans.predict(x_train_new)
```

In [10]:

```
from wordcloud import WordCloud, STOPWORDS
def wordcloud(temp):
```

```
def wordcloud(temp):
    values=data[temp]['essay']
    comment_words = ' '
    stopwords = set(STOPWORDS)

    for val in values:

        # typecaste each val to string
        val = str(val)

        # split the value
        tokens = val.split()

        # Converts each token into lowercase
        for i in range(len(tokens)):
            tokens[i] = tokens[i].lower()

        for words in tokens:
            comment_words = comment_words + words + ' '

    wordcloud = WordCloud(width = 800, height = 800,
                    background_color ='white',
                    stopwords = stopwords,
                    min_font_size = 10).generate(comment_words)

    # plot the WordCloud image
    plt.figure(figsize = (8, 8), facecolor = None)
    plt.imshow(wordcloud)
    plt.axis("off")
    plt.tight_layout(pad = 0)

    plt.show()
```

In [11]:

```
clusters=5
for i in range(clusters):
    print(("*"*20)+str(i)+" cluster"+("*"*20))
    temp=(predicted==i)
    print(data[temp][:5])
    wordcloud(temp)
```

```

4. Applying AgglomerativeClustering

In [12]:

```
def infoClusters(clusters,predicted):
    for i in range(clusters):
        print(("*"*20)+str(i)+" cluster"+("*"*20))
        temp=(predicted==i)
        print(data[temp][:5])
        wordcloud(temp)

K = range(2,10,2)
for k in K:
    ac = AgglomerativeClustering(n_clusters=k)
    predicted = ac.fit_predict(x_train_new.toarray())
    print(("*"*20)+" Agglomerative clustring with clusters of "+str(k)+("*"*20))
    infoClusters(k,predicted)
```

```

5. Applying DBSCAN

In [13]:

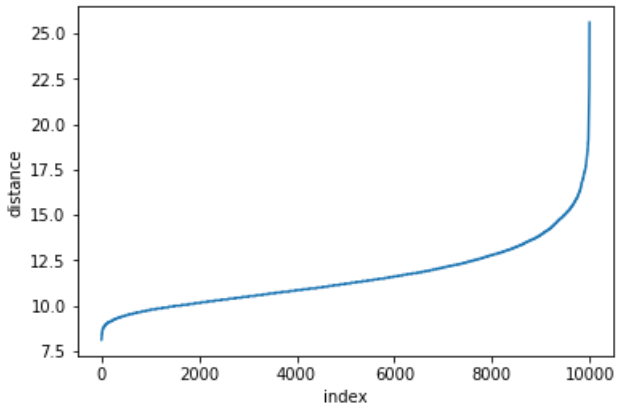
```
from sklearn.neighbors import NearestNeighbors
nbrs=NearestNeighbors(100)
nbrs.fit(x_train_new)
distances, indices = nbrs.kneighbors(x_train_new)
```

In [14]:

```
plt.plot(sorted(distances[:,-1]))
plt.xlabel('index')
plt.ylabel('distance')
```

Out[14]:

```
Text(0, 0.5, 'distance')
```



In [16]:

```
#optimal value of epsilon=15
def infoClusters(num_clusters,predicted):
    for i in range(num_clusters):
        print(("*"*20)+str(i)+" cluster"+("*"*20))
        temp=(predicted==i)
        print(data[temp][:5])
        wordcloud(temp)

dbscan = DBSCAN(min_samples=100,eps=15)
predicted = dbscan.fit_predict(x_train_new.toarray())
num_clusters=np.max(predicted)+1
print(("*"*20)+" DBSCAN Clustering"+("*"*20))
infoClusters(num_clusters,predicted)
```

```

6. Conclusions

K Means:

- K means is doing good job in seperating data points based on characterstics.And we can observe project categories are grouped as clusters.

Agglomerative:

- Agglomerative clustering with number of clusetrs as 2 is not able to cluster the data effectively.But Where as with number of cluster as 4 it was doing decent job.

DBSCAN:

- Unfortunately DBSCAN algorithm is not able to good job as it gave everthing as one cluster.one possible reason could be dataset is highly overlapped in 5k dimension space.
